MatchRead — Cincinnati Cleanup Checklist

For: Launch engineer **Date:** 11 August 2026 **Rehearsal:** Cincinnati, 13 August 2026 **Public launch:** 20 August 2026 **US Open draw:** about 27 August 2026

How to use this document

1. Work through the gates in order: Gate 1, then Gate 2, then Gate 3, and so on.
2. Finish one gate before you start the next gate.
3. Each task has a **Do this** section and a **Done when** section.
4. Only tick the box when the **Done when** test passes.
5. Do not start new features. This is cleanup work only.

If a task is not clear, ask before you build. Do not guess.

Words used in this document

Word	Meaning
ref	The short ID for a tournament. Example: `uso-2026`.
anon	A visitor with no account and no sign-in.
RLS	Row Level Security. The database rules that decide who can read what.
lock	The moment when users can no longer change their bracket.
settlement	The job that scores brackets after a match finishes.
listener	The always-on service that receives live match data from the provider.
pre-draw	A tournament that exists, but its draw is not published yet.

GATE 1 — Tournament data and state

This gate must be green before the Cincinnati rehearsal on 13 August.

[ ] 1.1 Fix the wrong calendar link

On `/tournaments`, the ATP Montreal row links to `/enter/uso-2026`. This is wrong. It should link to the Montreal event.

Do this

- Do not fix only that one row.

- Find the real cause. Check these four options:
  1. The `ref` value is wrong in the database.
  2. The UI is using the wrong array index.
  3. ATP and WTA records are sharing or swapping refs.
  4. The link is built by string joining instead of read from the tournament record.
- Make every calendar link read the `ref` from the tournament object.

Done when

- Every row on `/tournaments` opens the correct tournament.
- No link in the codebase builds a tournament URL by hand.

[ ] 1.2 Show all upcoming tournaments

The calendar is missing events. These six must appear:

Tour	Tournament	Dates
ATP	Cincinnati	13–23 Aug 2026
WTA	Cincinnati	13–23 Aug 2026
ATP	Winston-Salem	23–29 Aug 2026
ATP	US Open	30 Aug – 13 Sep 2026
WTA	US Open	30 Aug – 13 Sep 2026

Do this

- Do not add rows by hand to make the page look correct.
- `uso-2026` already exists in the database. Find out why it does not appear.
- Check each of these:
  - Date window logic
  - A filter that requires a published draw
  - Tournament status filter
  - Tour filter
  - The server query
  - Cached data

Important rule: A tournament must be able to appear in public **before** its draw exists.

Done when

- All six events appear on `/tournaments`.
- You can explain in one sentence why they were missing.

[ ] 1.3 Prove the lock works in the database

The UI is not the authority. The database is the authority.

Do this

- Choose a tournament that has already started.
- Send a write directly to the database. Do not use the website.
- Try to insert or update a pick.
- The database must refuse it.

Done when

- Started tournament + direct write = database error.
- You have saved the error output as evidence.

Then, separately: fix the UI labels. Today the site shows "Open" on Toronto and Montreal. Both are already in play. The label must match the real state.

[ ] 1.4 Prove the pre-draw tournament state

Use a future tournament with no published draw. The US Open is a good example.

Done when all of these are true

- [ ] `/tournaments/[ref]` renders
- [ ] Tournament name, dates, surface and tour render
- [ ] The status is clear to a normal user
- [ ] A countdown renders
- [ ] League and invite links work
- [ ] No empty or fake bracket is shown
- [ ] The page tells the user when picking will open

This page is important. From 20 August to 30 August it is the main page for new users.

GATE 2 — Public tournament page

Do Gate 2 in this order. Task 2.1 comes first. Do not change the order.

[ ] 2.1 Run the anonymous security test first

Do this

- Run pgTAP suites `0028`, `0029` and `0030`.

- Run them as the `anon` role. Do not run them as the table owner.
- These suites have never been run. Expect failures. Fix them.

Prove that anon CAN read:

- Tournament data
- Draw data
- Seat data needed to render the official bracket

Prove that anon CANNOT read:

- Another user's predictions
- Private bracket selections
- Private league membership data

Done when

- All three suites pass as `anon`.
- Both lists above are proven by a test, not by reading code.

Do not start task 2.2 until this passes.

[ ] 2.2 Build the public tournament page

Build `/tournaments/[ref]`.

Requirements

- [ ] Anonymous users can open it. No sign-in.
- [ ] Server rendered
- [ ] Search engines can index it
- [ ] The official draw is visible
- [ ] Tournament information is visible
- [ ] Correct pre-draw state
- [ ] Correct live state
- [ ] Correct completed state

This becomes the main public URL for a tournament.

[ ] 2.3 Change where calendar rows link

Do this

- Calendar rows must link to `/tournaments/[ref]`.
- Calendar rows must **not** link to `/sign-in?next=/enter/...`.

Rule: Viewing tennis is public. Playing is private.

[ ] 2.4 Require sign-in for picking only

The flow for Cincinnati and for launch:

```
view draw  →  click a pick  →  sign in  →  enter bracket
```

- An anonymous user can read the whole official draw.
- When the user clicks a pick, ask for sign-in.

Do not build this now: saving anonymous picks and restoring them after sign-in. That is a later experiment.

[ ] 2.5 Protect private brackets after lock

After a bracket locks, the public page may show:

- The official draw
- Completed results
- Live results and status

The public page must **never** show another member's private bracket.

Done when

- A test proves anon cannot reach another user's picks through this page.

GATE 3 — Public launch quality

Finish before 20 August.

[ ] 3.1 Fix date formatting

Today the landing page shows `2026-08-03`. The calendar page shows `03 AUG 2026`. This is not consistent.

Do this

- Build one shared date formatter. Use it everywhere.
- It must work for `en`, `es` and `ja`.
- Show a date range, not only the start date.
- Never show a raw ISO date in the UI.
- Do not hard-code English month names.

Correct example: `3–13 Aug 2026`

[ ] 3.2 Add social share tags

Today there are no Open Graph tags on any page. Shared links look like plain text.

Add to every public page:

- `og:title`
- `og:description`
- `og:image`
- `og:url`
- `twitter:card`

Done when

- A link pasted into iMessage, WhatsApp, Slack and X shows a title, a description and an image.
- The shared link points to `/tournaments/[ref]`, not to a sign-in page.

[ ] 3.3 Add page titles

Today every page is titled `MatchRead`. This is not useful.

Examples of correct titles:

- `Cincinnati Open | MatchRead`
- `US Open | MatchRead`
- `Tournaments | MatchRead`
- `My Bracket | MatchRead`

[ ] 3.4 Fix the landing page "Upcoming" message

Today the landing page says the calendar is waiting to be confirmed. This is wrong when tournaments exist.

Do this

- If tournaments exist, show them.
- If no tournament is upcoming, show the next real date. Do not show a vague message.

[ ] 3.5 Remove the 128-player showcase from the web platform

Delete `/showcase`. Do not repair it.

Today it shows 128 rows like `Player47XX`. The landing page sends new users to it. After Gate 2, `/tournaments/[ref]` shows a real draw. A real draw does this job better. The showcase is no longer needed.

Do this

- [ ] Delete the `/showcase` route and its page files
- [ ] Delete the 128-player fixture file
- [ ] Delete components that only the showcase used
- [ ] Change the landing page button "See what it looks like" to open a real public tournament page
- [ ] Remove every link to `/showcase` from the nav, the footer and the sitemap
- [ ] Add a redirect: `/showcase` → `/tournaments`, so old shared links do not show a 404 error
- [ ] Remove the showcase entry from the screen registry, then regenerate the docs
- [ ] Search the whole codebase for the word `showcase` and remove what is left

Done when

- `/showcase` redirects. It does not render a page.
- No file in `apps/web` mentions the showcase.
- The landing page button opens a real tournament.
- Build, typecheck and lint all pass.
- No unused imports remain.

One note for the record. The screen inventory describes the showcase as a build-time check: if a data shape changes, the showcase stops compiling and warns you. Deleting it removes that warning. This is accepted. Write one line in `KNOWN_WEAKNESSES` so the reason is not lost.

GATE 4 — Observability

Move this before other cleanup work. A rehearsal with no error visibility is wasted.

[ ] 4.1 Add error tracking

Sentry, or a similar tool, must be live before the Cincinnati rehearsal.

It must report:

- Server errors
- Browser errors
- Failed tournament page loads
- Failed bracket submissions
- Sign-in failures
- Provider and ingestion errors

[ ] 4.2 Add basic analytics

PostHog. Keep it small for now.

Track these nine events:

1. `tournament_viewed`
2. `draw_viewed`
3. `pick_started`
4. `sign_in_started`
5. `bracket_started`
6. `bracket_submitted`
7. `league_created`
8. `invite_opened`
9. `league_joined`

More events can be added after launch.

GATE 5 — Platform operations

These do not appear on the website. They are still launch blockers.

[ ] 5.1 Schedule settlement

Today, nothing runs settlement automatically. Every `pg_cron` line in the repository is a comment.

Not enough:

- The code exists
- The tests pass
- You ran it by hand

Done when you can show this chain in production:

```
match finishes  →  scheduled job runs  →  MatchRead state updates
```

[ ] 5.2 Deploy the live ingestion listener

Today the container does not exist. There is no `Dockerfile` and no host configuration. You are writing a small new application, not deploying an existing one.

Prove that the listener is:

- [ ] Deployed
- [ ] Running all the time

- [ ] Authenticated
- [ ] Reconnecting after it loses connection
- [ ] Receiving provider events
- [ ] Mapping events correctly
- [ ] Saving state
- [ ] Visible in monitoring when it fails

Done when you can show this chain in production:

```
provider live event  →  MatchRead backend  →  visible update on the site
```

Definition of done — Cincinnati rehearsal

The rehearsal is **not** finished because the pages look correct.

The rehearsal is finished when you can demonstrate all 14 steps in order:

- [ ] 1. An anonymous user opens MatchRead.
- [ ] 2. The user sees Cincinnati on the calendar.
- [ ] 3. The user opens Cincinnati without signing in.
- [ ] 4. The official draw renders correctly.
- [ ] 5. The user tries to make a pick.
- [ ] 6. Sign-in happens.
- [ ] 7. The user completes a valid bracket.
- [ ] 8. Entry locks at the correct deadline.
- [ ] 9. Live match data arrives in MatchRead.
- [ ] 10. Results update.
- [ ] 11. Settlement runs.
- [ ] 12. Standings and scores update.
- [ ] 13. Errors are visible in the error tool.
- [ ] 14. A second anonymous user cannot see private picks.

Everything else waits until these 14 steps work.

Three rules for this period

1. **No new features.** Cleanup only.
2. **Prove it, do not assume it.** A test that has never run is not evidence.
3. **Ask when unsure.** A question costs minutes. A wrong guess costs the launch window.
